The present sequence for universal PCR primer 220-11 is 1 of 8 universal oligonucleotides (AAS04211-AAS04218) used in the isolation of the human SCF (stem cell factor) CDNA sequence. The present invention relates to novel stem cell factors (AAU02761-AAU02767, AAU02770-AAU02797) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02777-AAU02794) and the oligonucleotides.

CAAS04182-AAS04210) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in SCF is useful for producing SCF and useful in setul for treating disorders involving blood cells cuch as myelofibrosis, methodstatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis; military tuberculosis, and seminated fungus disease, Pulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation and vitiligo

                                                                        AAS10448/
                                                                                                                 The present sequence for universal PCR primer 220-11 is 1 of 19 PCR primers (AAS10435-AAS10453) used to amplify various portions of the human SCF cDNA sequence. The sequence is described in an invention relating to novel stem cell factors, the polynucleotides encoding them and methods number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietic progenitor cells in human peripheral blood by administering a haematopoietic progenitor cells in human peripheral blood polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, malaria, vitemin B12 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Increasing the number of early hematopoietic progenitor cells in the peripheral blood useful for the treatment of blood disorders including Hodgkin's disease comprises the administration of human stem cell factor.
                                                                                                                                                                                                                                                                                                                                            Human, stem cell factor; SCF; haematopoietic progenitor cell;

The present sequence for universal PCR primer 220-7 is 1 of 19 PCR primers (AAS10435-AAS10453) used to amplify various portions of the human SCF cDNA sequence. The sequence is described in an invantion relating to movel stem cell factors, the polymucleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor by administering are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteoperrosis, metsatatic carcinoma, acute lenkaemia, multiphe myeloma, Hodgkin's disease, refractory anaemia, lymphoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increasing the number of early hematopoietic progenitor cells in the peripheral blood useful for the treatment of blood disorders including Hodgkin's disease comprises the administration of human stem cell factor.

Example 3; Fig 12C; 217pp; English.

The present invention relates to novel non-naturally-occurring stem cell factor (SCF) polypeptides having an amino acid sequence sufficiently challed to the control of that of naturally-occurring SCF to allow possession of haemale activity of naturally occurring SCF. Sequences of the invention are useful for treating leucopaenia, thrombocytopaenia, anaemia and for enhancing bone marrow recovery in treatment of radiation, engraftment of bone marrow during transplantation in mammals and chemical or chemocherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immune deficiency in a human, nerve damage, neoplasia, infertility, myeloproliferative disorder, intestinal chamage in a mammal. SCF sequences are useful for proparing biologically active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of serior mammal. They are useful for treating myelofitheses, myelosase, costeopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, costeopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, costeopetrosis, metastatic splenomegaly, Kala azar, sarcoidosis, primary tuberculosis, Pulminating septicaemia, pyridoxine deficiency, vitamin Bl2 and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation and vitiligo. The present sequence is a PCR primer which is used for amplifying the 5' end of rat SCF cDNA. This sequence is used in the cost amplifying the struction of the invention

Novel non-naturally-occurring stem cell factor polypeptide, useful for treating leucopenia, thrombocytopenia, anemia and for enhancing engraftment of bone marrow during transplantation in a mammal. Suggs SV, Martin FH; Zsebo KM, Bosselman RA, WPI; 2002-350789/38.

Example 3; Fig 12C; 217pp; English.

The present invention relates to novel non-naturally-occurring stem cell factor (SCF) polypeptides having an amino acid sequence sufficiently duplicative of that of naturally-occurring SCF to allow possession of haemacopoietic biological activity of naturally occurring SCF. Sequences of the invention are useful for treating leucopaenia, thrombocytopaenia, anaemia and for enhancing bone marrow recovery in treatment of radiation, engraftment of bone marrow during transplantation in mammals and chemical or chemotherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immume deficiency in a human, nerve damage, neoplasia, infertility, myeloproliferative disorder, intestinal damage in a mammal. SCF sequences are useful for preparing biologically active polymer polypeptide adduct, for enhancing transfection of early haemacopoietic progenitor cells with a gene, and transfer of a gene into a mammal. They are useful for treating myelofibrosis, myelosclerosis,

Production of a human stem cell factor (SCF) polypeptide for treating disorders involving blood cells, such as leukemia, comprises culturing mammalian cells comprising non-human SCF promoter DNA linked to DNA encoding the human SCF.

Example 3; Fig 12C; 120pp; English.

The present invention relates to novel stem cell factors (SCFS), polymuclectide sequences encoding the SCFS, and methods of producing them. SCFS are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for

```
ö
the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present sequence representing a universal oligonucleotide for SCF DNA is used in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                              Stem cell factor; SCF; blood-forming system; blood cell disorder; haematopoietic system; metastatic carcinoma; acute leukaemia; multiple myeloma; Hodgkin's disease; lymphoma; malaria; vitiligo; refractory erythroblastic anaemia; miliary tuberculosis; cytostatic; adisseminated fungus disease; haematopoietic; tuberculostatic; antianaemic; antifungal; antimalarial; dermatological; ss.

The present invention relates to novel stem cell factors (SCFB), polynuclectide sequences encoding the SCFB, and methods of producing them. SCFB are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgin'n sidisease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus treating culturing to DNA Production of a human stem cell factor (SCF) polypeptide for disorders involving blood cells, such as leukemia, comprises mammalian cells comprising non-human SCF promoter DNA linked sxample 3; Fig 12C; 120pp; English. the human SCF. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 4788; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antieense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitiflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, numbering an expiratory, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of of or reducing sensitivity to adenosine, reducing levels of condition, increasing bronchoconstriction, lung surfactant in a subject states, or a respiratory disease or condition.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the instraint acodon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antisflammatory steroid and ubjudinone. A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory ing or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing purchedilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction.
                                                                                                                                                                    ö
Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating ailments associated with impaired

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           haematopoietic activity and the polymucleotides encoding them. The polymeptides are used for treating infertility, intestinal damage, myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia, for improving engraftment of bone marrow transplants, for enhancing bone marrow recovery after radiotherapy or chemotherapy and in treatment of immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New non-natural stem cell factor, useful for treating e.g. leucopenia or immune deficiency, also related nucleic acid and antibodies.
                                                                                                                                                                                                                                                                   Stem cell factor; SCF; haematopoietic activity; infertility; intestinal damage; myeloproliferative disorder; leucopenia; thrombocytopenia; anaemia; bone marrow transplant; immune deficiency; neoplasia; nerve damage; osteoporosis; metastatic carcinoma; leukaemia; miliary tuberculosis; haematopoietic progenitor cell; ss.

polynucleotides can be used for recombinant expression of the polypeptides and also as probes for mapping of the SCF gene, for flatentifying SCF-related diseases and as a marker for neighbouring genes. Antibodies raised against the polypeptides are useful in diagnosis and to remove SCF from blood. This sequence represents SCF related DNA of the

The polypeptides are used for treating infertility, intestinal damage, myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia, for improving engraftment of bone marrow transplants, for enhancing bone marrow recovery after radiotherapy or chemotherapy and in treatment of immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New non-natural stem cell factor, useful for treating e.g. leucopenia or immune deficiency, also related nucleic acid and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Stem cell factor; SCF; haematopoietic activity; infertility; intestinal damage; myeloproliferative disorder; leucopenia; thrombocytopenia; anaemia; bone marrow transplant; immune deficiency; neoplasia; nerve damage; osteoporosis; metaetatic carcinoma; leukaemia; miliary tuberculosis; haematopoietic progenitor cell; ss.

                                                                                                                                                                                                                                                                                                                                                                                         ö
carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF polymclectides can be used for recombinant expression of the polymclectides and also as probes for mapping of the SCF gene, for flachtifying SCF-related diseases and as marker for neighbouring genes. Antibodies raised against the polypeptides are useful in diagnosis and to remove SCF from blood. This sequence represents SCF related DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene expression - by amplification of mRNA followed

                                                                               expression - by amplification of mRNA followed
                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysis, gene expression, reverse transcription; primer, cDNA; aggregate, restriction enzyme; ss.

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate
                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNNs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ7547-075798) and using the aggregate of mRNNs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digest aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

Reverse transcription primer used in cDNA analysis technique.

(first entry)

04-AUG-1995

AAQ75614 standard; DNA; 21 BP.

```
double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                - by amplification of mRNA followed
                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abblied reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abablled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                        gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           expression - by amplification of mRNA followed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAQ7547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
                                                                                                                                                                                                                                    Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                            double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GRNESGO files ARQ75347-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysis; gene expression; reverse transcription; primer; cDNA;
aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1.0%; Score 18.4; DB 1; Length 21; 95.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c)
                                                                                                                                                                                                                                                                                                                                                                                                                                     Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                 expression; reverse transcription; primer; cDNA;
                                                                              Reverse transcription primer used in cDNA analysis technique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        / Match 1.0%; Score 18.4; DB 1; Length 21; Local Similarity 95.0%; Pred. A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GBNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         당당

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                  Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GBNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an aphencype the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1.0%; Score 18.4; DB 1; Length 21; 95.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is updect to loss of heteroxygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a pecific inhibitor (ASI) targeted to an allele of a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the patient are heteroxygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms present in the normal somatic cells, and the first gene. The products and methods can be normal somatic cells, and the first gene. The products and methods can be cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic centers, atherosclerotic plaques, premalignant metaplastic or dysplastic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  graft versus host disease. The method can also be used to remove
malignant cells from bone marrow transplants. AA225812-226825 represent

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset confidate polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Eredreich's ataxis, myotonic dystrophy, hyperandrogensemia, spinal and bulbar atrophy and spinocereballar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs
                                                                                                                                                                                              Identifying a candidate polymorphic repeat within a coding sequence, funderstanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               b

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method for analysing a nucleic acid strand to determine the degree of complementarity between two sequences. This involves the measurement of an electric current along the annealed strands compared to a standard. This is useful in the analysis of genetic polymorphisms and variation between genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determining complementarity of nucleotide fragment for gene analysis, by comparing flow of electric current from or to electroconductive substrate through DNA fragment, with reference obtained from its complement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPOUS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present line present in the present line anti-free and can be used in vaccines. (I) or an anti-body binding (I) can be used for suppressing the immune system for reducing rejection of tissue or organ transplants and grafts and for treating T-cell specific arthritis, multiple sclerosis, diabetes mellitus, inflammatory bowel disease and crohn's disease. The anti-bodies can also be used for treating immunologic renal diseases. The anti-bodies can also be used for treating diseases, chronic lymphocytic leukaemia, secondary glomerulonephritis or vasculitis associated with lupus, polyarteritis, scleroderma, HIV-related diseases, amyloidosis and haemolytic uraemic syndrome. (I) and the anti-bodies can also be used for renal or urological neoplasms and multiple myelomas, asthma, bronchitis, emphysema and other chronic airway diseases. Human zcytor19 is located to chromosome light or renal in which is chromosome light from the present sequence represents a PCR primer which is

      36-JUN-2002.
    Achiral linker reagents have been developed for the incorporation of multiple amino groups into oligonucleotides. The present sequence represents a modified oligodeoxyribonucleotide. The achiral linker reagents can be used for incorporation of multiple primary amino groups or reporter groups into oligonucleotides. They are compatible with conventional DNA synthesis following the phosphoramidite methodology, and can be incorporated in good yields. They linker reagents may be used for labelling of oligonucleotides. They may also be used for preparation of oligonucleotides, e.g. for use as hybridisation probes, for use as primers in the polymerase chain reaction or in nucleic acid sequencing binding proteins or other biomolecules, for production of affinity matrices for detection of nucleic acid sequences, for cloning recombinant

sapiens. Synthetic

WO200244209-A2

```
The invention relates to human phosphatase 79 (AAB71700), nucleic acids encoding it (AAH24264), and a method for the recombinant production of human phosphatase 79. The present invention additionally discloses an agonist of phosphatase 79 for therapeutic use, and an antibody which specifically binds to human phosphatase 79. Human phosphatase 79, and cucleotides which encode it may be used for treating a variety of diseases, such as malignant tummors, blood diseases, HIV (human conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide cat be used as a primer for nucleic acid amplification reaction or as a primer for nucleic acid amplification reaction or as a microarrays. Sequences AAH224265 represent reverse transcription-cept (RT-PCR) primers used in an exemplification of the invention to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for destabilising non-specific duplex formation, between an oligonucleotide and a target nucleic acid (NA), comprising incubating the target NA with a modified oligonucleotide (I) comprising a homopolymeric sequence having a modification which decreases or abrogates H-bonding between the modified oligonucleotide and the non-specific target NA. The modified oligonucleotide is used to improve discrimination between the targeted homopolymeric sequence and a non-homopolymeric target sequence. It is used to increase the proportion of full length cDNA clones for a library, to reduce mispriming during sequencing, 5, or 3, RACE (rapid amplification of cDNA ends) or DNA synthesis or to generate bons fide genetic markers. The present sequence represents an oligonucleotide which is used in the exemplification of the
                                                                                                                                                                                                                                                                              Novel method of stabilizing duplex formation, or destabilizing non-specific duplex formation using primer containing modified nucleotide analogs, useful for preventing mispriming during PCR, RACE, DNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes the human FD 17 protein (I). (I) has actostatic, virucidal, immunomodulatory, antinflammatory and haemostatic activities. The polynucleotide encoding (I) can be used in gene therapy. (I) and the polynucleotide encoding it are applicable in the diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence represents a PCR primer for human FD 17, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of human transcriptional activation subunit 14, and the polymucleotide encoding it. Also described is the process for preparing the protein by DNA recombination and the application of the polypeptide and polymucleotide in treating various diseases such as malignant neoplasms, haematopathy, human immunodeficiency virus (HIV) infection, immunological diseases, and various inflammations. Antagonists against the polypeptide can also be used in treating such diseases. The present sequence for reverse transcriptase (RT)-PCR primer #2 is used with RT-PCR primer #1 (ABK13714) for isolating cDNA encoding human transcriptional activation subunit 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human transcriptional activation subunit 14 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, transcriptional activation subunit 14; malignant neoplasm; haematopathy; cytostatic, HIV infection; human immunodeficiency virus; immunological disease; inflammation; virucide; immunomodulatory; antiinflammatory; reverse transcriptase-PCR; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RT-PCR primer #2 for human transcriptional activation subunit 14 cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the isolation of polypeptide-laminin B210.67, and the polymucleotide encoding it. Also described is the process for preparing the protein by DNA recombination. The polypeptide is useful for treating diseases such as embryo development teratogenesis. The present sequence for reverse transcriptase (RT)-PCR primer #1 is used with RT-PCR primer #2 (ABK12410) for isolating cDNA encoding polypeptide-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptide-laminin B210.67, useful for treating diseases such as embryo development teratogenesis.

(-)-limonene-6-hydroxylase primer 3.B.

24-FEB-2000.

```
The invention relates to nucleotide sequences encoding spearmint (-)-
limonene-6-hydroxylase (L6H) and peppermint (-)-limonene-3- hydroxylase
(L3H). Host cells containing a vector comprising the nucleotide sequences
can be used for the recombinant production of limonen hydroxylases or of
primary enzyme products. The primary enzyme products are trans-carveol in
the case of (-)-L6H or trans-isopiperitenol in the case of (-)-L3H, which
are of subsequent use, to obtain enhanced expression of limonen
hydroxylase in plants to attain enhanced trans- carveol or trans-
isopiperitenol production as a predator or pathogen defense mechanism,
attractant or environmental signal. The limonene hydroxylase cDNAs also
provide a useful tool for isolating other monoterpene hydroxylase genes
cand for examining the developmental regulation of monoterpene
blosynthesis. Sequences AAXO6564-73 represent primers for the PCR
maplification of (-)-limonene-6-hydroxylase cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated limonene hydroxylase nucleic acids - which encode limonene-6-hydroxylase and limonene-3-hydroxylase, which can be used to produce trans-carveol and trans-isopiperitenol.

The present primer was used to reverse transcribe cDNA encoding a C-20 oxidase. The amplifie fragment is used in the method of the invention. The specification describes methods for the inhibition and control of gibberellic acid levels. Gibberellic acid levels may be inhibited or controlled by use of a chimeric expression construct expressing a RNA or protein which suppresses the gibberellin biosynthetic pathway sequence, diverts substrate from the pathway, or degrades pathway substrates or products. The methods uses copalyl diphosphate synthase, 3beta- hydroxylase, plytroene synthase, C-20 oxidase, and a choracylase, plytroene synthase, C-20 oxidase, and a choracylase polynucleotides to achieve this. The method is used to control seed germination and seedling growth especially to regulate gene products of gibberellin biosynthetic pathway and restoration of normal seed germination, in transgenic plants. The plants produced are gibberellin deficient, and have shortened hypocotyl and/or epicotyl phenotypes compared to normal plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fatty lesion development, atherosclerosis, Alzheimer's disease; nervous system disorder; parkinson's disease; immune system disorder; ischaemia; lymphopaemia; leukocyte adhesion deficiency syndrome; haemoglobinuria; anaemia; hyperproliferative disorder; Gaucher's disease; coagulation disorder; blood platelet disorder; autoimmune disorder; Garderis; ships herpes simplex; Addison's disease; rheumatoid arthritis; Garave's disease; gene therapy; antiarteriosclerotic; immunostimulant; cardiovascular; antiviral; primer; ss.
                                                                                                                                                                                                                                                                                   Obtaining transgenic plant useful for controlling seed germination and seedling growth comprises transgene comprising a sequence expressing altered levels of an essential hormone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                   The present invention relates to an isolated nucleic acid regulated by fatty lesion development, which comprises any of 55 polynucleotide or sequences from Orycotolagus cuniculus. The polynucleotide, polypetide or antibody is useful for preventing, treating, modulating or ameliorating a medical condition, particularly atherosclerosis. The invention is used as a marker or detector of nervous system disorder or disease (e.g. Parkinson's disease, ischaemia, dementia). The invention may also be useful for treating deficiencies or disorders of the immune system (e.g. lymphopaenia, leukocyte adhesion deficiency syntheticome or haemoglobinuria, anaemia), hyperproliferative disorders (e.g. Gaucher's disease), infectious disease (e.g. herpes simplex), coagulation disorders, blood platelet disorders and autoimmune disorders (Addison's disease, theumatoid arthritis, dermatitis, Grave's disease). The polynucleotide sequence is also used in gene therapy. The present sequence is a 3' sequencing primer used in the identification and characterisation of polynucleotides up-regulated by fatty lesion

The present invention describes isolated metalogues. Carlo molecules. (1) have neuroleptic, antimatic and antidepressant activities, and can be used in gene therapy. (1), polypeptides (11) comprising (1), are useful for preventing, treating, modulating or ameliorating a medical condition such as a neuropsychiatric disorder. (1) are useful as diagnostic agents for diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition such as neuropsychiatric disorder e.g. schizophrenia, a bipolar disorder or addiction-related behaviour. (1) are useful for detecting the presence of a nucleic acid encoding a protein in a mammalian tissue presence of a nucleic acid encoding a protein in a mammalian tissue cample. (1) can be used as probes and primers, for chromosome cidentification, to control gene expression through triple helix formation or antisense DNA or RNA, in gene therapy to treat the above mentioned alternative to restriction fragment length polymorphism (RFLP) and as an alternative to restriction fragment length polymorphism (RFLP) and as molecular weight markers for forensic purposes. (1) is also useful as molecular weight markers on Southern gels, diagnostic probes for the subtract-out known sequences in the process of discovering novel content support, to raise anti-DNA antibodism using DNA immunisation technique, and as an antigen to elicit an immune response. activated macrophage. The polynucleotides of the invention,

```
The present invention provides the protein and coding sequences of the peppermint and spearmint (-)-limonene-3-hydroxylase and the spearmint (-)-limonene-6-hydroxylase. Provided are a number of probes and PCR primers which were used to isolate the sequences. These are useful in the production of transgenic plants with altered flavour and aroma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mouse; microglia; macrophage; regulatory gene; digital sequence tag; DST;
                                     Novel isolated limonene hydroxylase encoding nucleic acid molecule, useful for altering production of limonene-6-hydroxylase or limonene-3-hydroxylase in suitable host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR-based total gene expression analysis; TOGA; infectious disorder; neuroinflammatory pathology; neurodegenerative disease; gene therapy; hyperproliferative disorder; autoimmune; inflammatory disorder; primer;

```

The present sequence represents a primer used to isolate novel mouse microglia and macrophage regulatory gene DST (dightal sequence tag) sequences. AASO6401-AASO6590 represent these novel sequences and the primer sequences used to isolate them. The PCR-based total gene primer sequences used to solate them. The PCR-based total gene expression analysis (TOGA) system is used to examine the expression pattern of molecules corresponding to genes that are regulated in unstimulated microglia, activated microglia, unstimulated macrophage and

New regulated genes of microglia and macrophages, useful for diagnosing, preventing or treating neuroinflammatory pathology and neurodegenerative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide useful in gene therapy for preventing, treating modulating or ameliorating a medical condition such as psychoses or a neuro psychiatric disorder e.g. schizophrenia, or a bipolar disorder in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to the cDNA sequences of novel isolated polynucleotides associated with psychoses or other neuropsychiatric disorders. The sequences of the invention may act as blockers of D_{-2} receptors in the meso-limbic dopamine system. The nucleotide sequences of the invention and the polypeptides encoded by them are useful in the manufacture of a medicament useful for preventing, treating, modulating
             polypeptides encoded by the and antibodies that bind to these polypeptides are useful are useful for the diagnosis, prevention, treatment or amelioration of a medical condition, preferably a neuroinflammatory pathology or a neurodegenerative disease such as Alzheimer's disease, senile dementia, Parkinson's disease, obsessive compulsive disorders, eppliapsy, schizophrenia, multiple sclerosis, depression and bipolar manic-depressive used for detecting or treating infectious disorders (e.g. AIDS), hyperproliferative disorders (e.g. ancer), immune diseases (e.g. insulin dependent diabetes mellitus), inflammatory disorders (e.g. arthritis). The polynucleotides can be used inflammatory disorders (e.g. arthritis). The polynucleotides can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Central nervous system; CNS; neuroleptic; mouse; human; psychoses;

antibody that binds the proteins of the invention is useful for preventing, treating, modulating or ameliorating neurological disorders beychoses or other neuropsychiatric disorders in a subject. The sequences are also useful for disorders in a subject. The sequences are also useful for disorder such as psychoses or a subject subject billty to a neurological disorder such as psychoses and other neuropsychiatric disorders in a subject by determining the presence or absence of mutation in the nuclectide sequence of apolipoprotein D or by determining the alteration in the nuclectide sequence of apolipoprotein D or by determining the alteration (increase or decrease) in the expression of apolipoprotein D. The sequences of the invention are useful in treating deficiencies or disorders of the central nervous system by activating or inhibiting the proliferation, and interesting or inhibiting the proliferation, and interesting or inhibiting the proliferation, and interesting or inhibiting the proliferation, and interest or detector of a particular nervous system disease or disorder such as Alzheimer's disease, pick's disease, Binswanger's disease, other senile dementia, entered as disease, obsessive compulaive disorders, epilepsy, encephalopathy, ischaemia, addiction, multiple sclerosis, depression and manic-depressive disorder. The present sequence represents an or particular used in the identification of the cDNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of the invention

complements, and degenerate variants, comprising a sequence selected from those given in ABQ73206 to ABQ73222 (NS), which is a digital sequence tag (DST) corresponding to mRNAs whose expression is regulated by The present invention describes an isolated polynucleotide (I) and its

The present invention relates to a method for preventing, treating, modulating or ameliorating a medical condition. The method involves administering one or more nucleic acid molecules up- or down-regulated in hepatitis B virus (HBV) infection or polypeptides encoded by the nucleic acid molecules or antibodies that bind to the polypeptide. The method is useful for preventing, treating, modulating or amaliorating a medical condition. It is also useful for determining the presence or absence of a mutation in the nucleic acid molecules or detecting an alteration in

proliferative lesion development caused by mechanically induced intimal hyperplasia, or by lercanidipine treatment, or by proliferative lesions and reversed by lercanidipine treatment. (I) has antiatherosclerotic activity and can be used in gene therapy. (I) can be used for diagnosing a medical condition (e.g. atherosclerosis) in a subject which involves determining the presence or absence of a mutation in (I) and diagnosing the medical condition based on the presence or absence of the mutation. (I) is also useful for diagnosing atherosclerosis, or the susceptibility to atherosclerosis in a subject which involves detecting an alteration (an increase or decrease) in amount of expression of (I). (I) is also useful for diagnosing or monitoring the effects of treating a subject with dihydrospridine calcium antagonist e.g., lercanidipine. (I) can also be used for preventing, treating, modulating, or ameliorating a medical condition such as atherosclerosis in a mammalian subject. The present
                                                                                                                                                                                                                                                  conditions but as atheroscierosis in a mammalian subject. The present exequence represents a TOGA primer which is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preventing and treating hepatitis viral infection in a mammal, comprises administering nucleic acid molecules that up· or down-regulate in hepatitis B virus infection or polypeptides encoded by the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primer #4 used for direct sequencing of TOGA generated PCR products.

hepatitis viral infection. The method is useful for assessing the stage of hepatitis viral infection (e.g., acute hepatitis versus chronic hepatitis) or assessing the efficacy or toxicity of therapeutic treatment for hepatitis viral infection and a gene expression profile is useful for identifying polypeptides and polynucleotides which are associated with hepatitis viral infection. Sequences of the invention are used in gene therapy and as vaccines. Nucleic acid sequences are useful as a diagnostic markers for HBV infection and for treating infectious diseases. The present DNA sequence is a PCR primer which is used for direct sequencing of TOGA (TOtal Gene expression Analysis) generated PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to control of gibberellin (GA) levels in plants. The method involves producing transgenic plants having a phenotype of reduced seed germination and reduced early seedling growth, then restoring seed germination and early seedling growth by treating plants with an appropriate compound when conditions are favourable. The method is useful to control seed germination and/or early seedling growth in agricultural production so that unfavorable environmental conditions normally reducing agronomic output can be avoided and yields increased. Plants also demonstrate increased uniformity of germination, emergence and seedling vigor, so increasing yields at harvest. The method is especially useful in crop plants such as e.g. canola, soybean, cotton, etc., and is also useful in storage and transport of seeds to reduce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Control of gibberellin levels in plants useful to avoid unfavorable conditions in crops to increase yields, using transgenic plants having reduced seed germination and early seedling growth then treatment to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes chimeric histone acetyltransferase polypeptides. The chimeric polypeptides comprise a polypeptide segment that exhibits histone acetyltransferase activity, and a polypeptide segment barbits histone acetyltransferase activity, and a polypeptide segment having 40% or greater segmence identity to a subunit of a histone deacetylase chromatin-associated protein complex. The chimeric polypeptides are useful for determining gene expression profiles in specific cells, for modulating gene expression in specific cells, and for making genetically modified eukaryotes. The present sequence represents a reverse transcription primer used in the method of the invention
premature germination which may affect agronomic or food quality of the seeds. The present sequence is a PCR primer used to isolate pumpkin 2beta -3beta hydroxylase cDNA. This primer is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric polypeptide comprising a histone acetyltransferase polypeptide segment and a segment comprising a histone deacetylase chromatin-associated protein complex subunit, useful for modulating gene expression in cells.

The invention relates to polynucleotides and polypeptides associated with atherosclerosis. Polynucleotides of the invention are useful for delivery of genes, DNA vaccines, diagnostic reagents, peptides, proteins or macromolecules. Sequences of the invention are useful for treating nervous system disorders (e.g., Alzheimer's disease, Parkinson's disease, multiple sclerosis, epilepsy), immune disorders (e.g., autoimmune disorders such as rheumatoid arthritis, Addison's disease, haemolytic anaemia, graft-versus-host disease, inflammation), hyperproliferative disorders (e.g., neoplasme) and infectious diseases (e.g., viral, or parasite infection). They are used for regeneration of tissues, to repair, replace or protect damage tissues, for increasing chemotaxis activity of cells, for increasing or decreasing the citerentiation or proliferation of publication of multiple mammalian characteristics, (such as body weight or height), for modulating mammalian metabolism affecting catabolism, consideration of mammal's mental or physical state, or as a food additive or preservative. The invention is useful in gene therapy. The present sequence is a sequencing primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 0 U; 1 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for preventing or treating a pathological condition (comprising ataxia telangiectasia (AT), AT tumours or other cancers), which comprises administering to a mammalian subject at least one of: (a) a first polynucleotide comprising a sequence having 38-889 bp (consisting of the sequences in ACC79319 to ACC79322 (I)) or a second polynucleotide at least 95% identical to the first polynucleotide (b) a third polynucleotide comprising at least 10-bp sequence that is hybridisable to the first polynucleotide under stringent conditions; or (c) a gene corresponding to any of (1)-(2) or another gene at least 95% identical to the gene. (I) have cytostatic activities, and can be used in vaccines and in gene therapy. The method is useful for preventing or treating e.g., ataxia telangisectasia (AT), AT tumours or other cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention describes a novel tumor-associated oligopeptide that is recognized as an antigen by CD8+ cytotoxic T lymphocytes (CTL) and causes CTL-induced lysis and/or apoptosis of tumor cells, especially multiple myeloma cells. The oligopeptide is derived from human PRD1-BF1 (positive regulatory domain I-binding factor-1) which is able to induce an MHC (major histocompatibility complex) Class I allele variant A2-restricted immune response of CD8+ CTL against tumor cells. The products of the invention have cytostatic activity and can be used in a vaccine. The peptide of the invention, also related retro-inverse and pseudopeptides, cusion proteins (RP), polymucleotides, vectors, host cells and antibodies and T cell receptors specific for PRDI-BF1, particularly tumors. The products of the invention are also useful as diagnostic, therapeutic and products of the invention are also useful as diagnostic, therapeutic and prophylactic agents for detecting, modifying, generating, expanding complyancing activation and functional status of T cells, and for preparation of poly- or mono-clonal or recombinant A2-restricted T cell receptors and their functional equivalents. This sequence represents and PEPPER primer used to amplify the human PRDI-BF1 gene described in the
                                                                                                                                                      New tumor-associated oligopeptide, useful particularly for treating multiple myeloma, is recognized by CD8 cytotoxic T cells, also derivatives and related nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1.0%; Score 18.2; DB 1; Length 19; 94.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a novel simplified TOGA (RTM) method for simultaneous sequence-specific identification of multiple mRNA molecules in a RNA population. The method involves characterising each of the sequence-specific polymerase chain reaction (PCR) products by partial sequence and length. The method is useful for determining tissue-specific patterns of gene expression or mechanisms of drug interaction. It is also useful for drug screening, studying physiological processes, genomic mapping or manufacture of diagnostic, prognostic or therapeutic reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                Simplified TOGA method for simultaneous sequence-specific identification of multiple mRNA molecules in mRNA population, useful for determining tissue-specific patterns of gene expression or mechanisms of drug

                                                       which comprises: (i) addition of a known common oligonucleotide sequence to at least one terminal of each DNA fragment, (ii) amplification of the resultant DNA fragment as a primer using a first common primer containing a complementary nucleotide sequence to the above mentioned known common complementary nucleotide sequence to the above mentioned known common oligonucleotide sequence to the prepared known common oligonucleotide sequence to the prepared known common oligonucleotide sequence optionally having been introduced with complementary nucleotide sequence at a terminal, and a specific primer capable of hybridisation with a DNA fragment containing whole or part of the gene having known sequence, to give amplified DNA, (iii) analysis of the amplified DNA to find the information of the DNA fragment, in which the specific primer is designed to prepare fragments of the common first and second primers and to give short fragment of amplified DNA and (iv) labelling them to make their differentiation. Differentiation of informations of known and unknown gene readily provides information of unknown gene and simultaneous monitoring of signals derived from minor genes Furthermore, labelling of DNAs according to functions of known

clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6) n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trail loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides. They are used in a method for detecting an antigen in a subject. The method involves blading the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo, removing any unreacted L, and then detecting the presence of the oligo. Removing any method can be used to detect Abs, in which case the ligand is an oligolable led Ag. The use of an amplificable oligo as the label allows Ag or Ab to be detected at very low levels. An exemplary olgi is AAQ75024 which can be covalently attached by the 5'- terminus to the N· or C-terminal of a synthetic peptide. In the example, peptide AR62941 was coupled to oligo AAQ75024 using disuccinimidyl suberate. Serum samples suspected to contain HEV Abs were immobilised on plastic tubes or wells, then incubated for 30-60 mins with the peptide-oligo proruct. The vessels were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Solid phase immunoassay using oligo:nucleotide as label - also new conjugates of oligo:nucleotide coupled to antigenic peptide, partic. for diagnosing hepatitis C or E virus infection.

They were used to prime cDNA synthesis from snapdragon (Antirkhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome P450 aguences (see also AAT94670-73). A cDNA clone (see AAT94657) encoding flavonoid 3' hydroxylase (see AAM9504) was isolated using a differential display approach. This can be used to manipulate the pigmentation of
washed; bound oligo was released with 0.2M glycine and amplified in a separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR. The amplification product - AAQ75031 - was treated with uracil DNA glycoslase to remove the U18 fragment, and the product captured by immoblised oligo-dr. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Flavonoid 3' hydroxylase; pigmentation; flower colour; transgenic plant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel flavonoid 3'-hydroxylase(s) from flowering plants - and corresponding DNA, used in the manipulation of pigmentation in plants.

The treatment comprises administration of such nuclease resistant oligonucleotides, targeted on a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease resistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. patients with acquired immunodeficiency syndrome or those receiving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chemotherapy or radiation therapy), optionally in combination with, or fused to, antiviral or other antimicrobial oligonucleotides. Apart from therapeutic use, the oligonucleotides can be used to control bacteria in laboratory cultures, foods, beerages and industrial processes. The oligonucleotides are specific for bacteria, without affecting metabolism in mammalian cells. They may also activate RNase H and have a general, non-specific immune-stimulating effect. The oligonucleotides can be administered orally, intranasally, rectally, topically or by injection, optionally coupled to an agent (e.g. carbohydrate or polyamine) that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s)

A method has been developed for labelling an oligonucleotide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to 3' exonuclease activity. The method can be used for detecting a gene. The method can detect a gene in a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Therapeutic composition containing antieense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a new composition for selective, sequence-specific inhibition of gene transcription and expression in a host. The composition comprises oligomelectides containing arabinose sugars that can hybridise to either a a single-stranded (ss) RNA to induce RNase H cleavage activity, or to a DNA/DNA or DNA/RNA duplax to form a triple helix, thereby inhibiting DNA replication and/or transcription. The oligoarabinonucleotides are used for antisense inhibition of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= a
/note= "Ribose moiety replaced by beta-D-arabinose"
      Labelling of an oligonucleotide - useful for detecting genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Beta-D-arabinose; antisense; inhibition; transcription; expreverse transcription; viral replication; RNase H cleavage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method has been developed for labelling an oligonucleotide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to 3' exonuclease activity. The method can be used for detecting a gene. The method can detect a gene in a sensitivity up to ten times higher than example from the present invention

               by retroviruses. The compositions are therefore particularly used to inhibit retroviral replication. The oligoarabinonuclectides can also be used, in combination with Rhase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonuclectides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to callular or serum proteins. They target se RNA, but not complementary as DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonuclectides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligoarabinonuclectides containing beta-57164 represent oligoarabinonuclectides containing beta-57164 represent exemplification of the present invention
   expression or to prevent DNA replication, or reverse transcription of RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication.

The invention relates to a new composition for selective, sequence-specific inhibition of gene transcription and expression in a host. The composition comprises oligonucleotides containing arabinose sugars that can hybridise to either a a single-stranded (ss) RNA to induce RNAse H cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The

```
expression or to prevent DNA replication, or reverse transcription of RNA by retroviruses. The compositions are therefore particularly used to inhibit retroviral replication. The oligorabinonucleotides can also be used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligorabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target ss RNA, but not complementary ss DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligoarabinous sequences AZSN160-287164 represent

cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple heltx, thereby inhibiting DNA replication and/or transcription. The oligoarabinound-cetides are used for antisense inhibition of gene expression or to prevent DNA replication, or reverse transcription of RNA by retroviruses. The compositions are therefore particularly used to inhibit retroviral replication. The oligoarabinouncleotides can also be used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinouncleotides have excellent affinity for RNA, increased nesistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target is RNA, but not complementary so DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal coligoarabinoucleotides. Sequences AAZ87165-Z87169 represent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligodeoxyarabinonucleotides containing 2'-deoxy-2'fluoro-beta-D-arabinose used in an exemplification of the present invention

Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication.

Example 2; Page 31; 91pp; English.

The invention relates to a new composition for selective, sequence-specific inhibition of gene transcription and expression in a host. The

Novel secreted factor encoded by clone P00108D12 which is differentially expressed in certain disease states, useful in diagnosing and treating cardiac, renal or inflammatory diseases.

```
composition comprises oligonucleotides containing arabinose sugars that
can hybridise to either a single-stranded (ss) RNA to induce RNAse H
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
chalix, thereby inhibiting DNA replication and/or transcription. The
cligoarabinonucleotides are used for antisense inhibition of gene
expression or to prevent DNA replication, or reverse transcription of RNA
cy retroviruses. The compositions are therefore particularly used to
inhibit retroviral replication. The oligoarabinonucleotides can also be
used, in combination with RNAse H, as reagente for sequence specific
cleavage or RNA mapping, and additionally for the study and control of
gene expression in cells. The oligoarabinoucleotides have excellent
cany non-specific binding to cellular or serum proteins. They target ss
RNA, but not complementary ss DNA, so may be useful for targetting
cretroviral genomic RNA to inhibit the early seages of viral replication.
Oligoarabinonucleotides containing pyrimidine bases form triple helices
with significantly higher thermal stability than those produced by normal
coligodeoxyarabinonucleotides containing 2-deoxy-2-fluoro-beta-D-
coligoarabinonucleotides containing 2-deoxy-2-fluoro-beta-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide #6 used for the preparation of normalised cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antiarrhythmic; antiarrerioscierotic; antiarheroscierotic; mephropathic; antidatheroscierotic; mephropathic; antidatheroscierotic; mephropathic; antidabetic; immunosuppressive; antidatheroscierotic; antiulcer; antibacterial; osteopathic; cerebroprotective; wasotropic; antiulcer; nootropic; neuroprotective; congestive heart failure; myocarditis; hypertrophic cardiomyopathy; angina pectoris; myocardial infarction; kidney disease; acute renal failure; renal glucosuria; renal infarction; polycystic kidney disease; hereditary nephritis; inflammatory disease; tumour angiogenesis; osteoarthritis; tooks syndrome; psoriasis; stroke; neural trauma; cerebral malaria; Crohn's disease; osteoporosis; ulcerative colitis; Alzheimer's disease; gene therapy; ss.

```
The present invention relates to an array of proteins (antibody mimics) comprising a fibronectin type III domain having a randomised loop, a randomised beta-sheet, or their combination, and has the capacity to bind to a compound that is not bound by a corresponding naturally-occurring fibronectin, immobilised onto a solid support. The antibody mimics is useful for detecting a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of to virtually any compound of interest. The present sequence is an oligonucleotide Al8-2PEG linker used in an exemplification of the
having a randomized loop, a randomized beta-sheet or their combination.

                                                                                                                                                             disease states accreted factor is differentially expressed in certain disease states. Secreted protein, its antibodies, antagonists or compositions comprising them are useful in the diagnosis and treatment of cardiac diseases such as congestive heart failure, myocarditis, cardiac diseases such as congestive heart failure, myocarditis, cardiac arrhythmia, arteriosclerosis, kidney diseases such as acute renal cardiac arrhythmia, arteriosclerosis, kidney diseases such as acute renal failure, renal glucosuria, renal infarction, nephrogenic diabetes calmingue, polycystic failure, nead infarction, nephrogenic diabetes inflammatory diseases such as asthma, autoimmune diabetes, tumour anglogenesis, rheumatoid arthritis, osteoarthritis, toxic shock syndrome, asthma, stroke, neural trauma, psoriasis, cerebral malaria, osteoporosis, crohn's disease, ulcerative colitis, Alzheimer; disease. Secreted protein DNA is useful in antisense-mediated gene inhibition and in gene therapy. An array comprising one or more oligonuclectides complementary to reference RNA or DNA encoding the secreted factor is useful for detecting cardiac, kidney and inflammatory disease. The present DNA containing secreted factor by preparation of a normalised cDNA library containing secreted factor DNAs. The normalised cDNA libraries are used in the identification of differentially expressed con at secreted factor bNAs. The normalised cDNA libraries are used in the identification of differentially expressed con at secreted factor bNAs. The normalised cDNA libraries are used in the identification of differentially expressed con a secreted factor bNAs. The normalised cDNA libraries are used in the identification of differentially expressed con a secreted factor bNAs.

The present invention describes a method of producing binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offset adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptor—indexers where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors Feng L, Latimer DR; Disclosure; Page 100; 101pp; English Lizardi PM, Roth ME, and adaptor-indexers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to waccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae haemophilus, campylobacter, closeridium, Becherichia coli and/or staphylococus), fungal antigens and/or parastitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or fimmune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (r) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, hemophilus, campylobacter, clostridium, Escherichia coll and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a final to a Thl immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                          The present sequence corresponds to polylinker DNA of the phagemid vector pDCR2.1. It was used in the construction of a normalised rat cDNA library, which was used in an example demonstrating differential expression of a rat gene referred to as clone PD0210D09. The invention relates to a polypoptide comprising a sequence of at least 80% identity to residues 22 122 of the present sequence, or a sequence encoded by a nucleic acid hybridising under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one biological sectivity of the polypoptide encoded by clone PD021009. The polypoptide and polynucleotides of the invention are useful for the treatment of cardiac, renal and inflammatory diseases. The polynucleotides are useful in antisense mediated gene inhibition and in gene therapy. The polypoptide are useful in assays for identifying lead compounds that may be used as therapeutic agents in the treatment of cardiac, kidney or

The sequences are useful for treating cardiac, renal or inflammatory diseases. These include cardiac diseases such as congestive heart failure, myocarditis, dilated congestive cardiachy angina pectoris, myocardial infarction, cardiac arrhythmia, pulmonary hypertension, arteriosclerosis, atherosclerosis and cardiac tumours, renal diseases such as glomerulonephritis, nephrotic syndrome, renal infarction, hereditary nephritis, polycystic kidney disease, chronic renal failure, renal vein thrombosis and medullary sponge kidney and inflammatory diseases such as asthma, rheumatoid arthritis, osteoarthritis, stroke, psoriasis, restenosis, graft versus host reaction, Crohn's disease, ulcerative colitis and Alzheimer's disease. Sequences AAS94745 represent CDNA clones, which encode the secret factor polypeptides of the invention, and oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anglogenesis inhibitor; ss; anglogenesis; solid tumour growth; tumour metastaais; precancerous lesion; rheumatorid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasis; rubeosis; osler-wbbber Syndrome; mycoardial anglogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; anglofibroma; wound granulation; intestinal adhesion; atherosclerosis;
